Abstract of the Disclosure

An information handling system includes a content database for storing content, a receiver for receiving information relating to a subscriber personal profile including subscriber content preferences, a text-to-audio converter coupled to the database for converting textual content to audio content, a content controller for selecting and mixing content from the content database according to the content preferences, a modulator coupled to the text-to-audio converter for modulating audio content to provide audio-modulated signals, and a transmitter coupled to the database for transmitting the content to a remote subscriber unit via a wireless link.
